

GTM Agent 演示台本 · 精简版（约 3 分钟）

黄色块 = 操作；蓝色块 = 照读旁白。不要 commit 此文件。

录制前检查

- [] 前后端运行中；浏览器最大化、隐藏书签栏、浅色模式、模型 gpt-4o
- [] Dune 四模块已生成（有评分徽章 + Steam 徽章）；Landscape 里没有 Nightingale
- [] 当前是空的新会话（建议按钮可见）；Moonhaven 已有完整分析
- [] 只录浏览器窗口；先录操作后配音

Scene 1 · 布局与控制（0:00 – 0:30）

【动作】全景静止 2 秒 → 鼠标划过三栏 → 点开模型下拉收起 → 点齿轮开 API Keys 停 2 秒 Esc 关 → 主题切暗再切回。

"GTM Agent — an AI analyst for game publishers. Left: the game brief. Middle: four modules forming a dependency graph — landscape feeds audience, both feed positioning and SWOT. Right: the agent that drives it all."

"Up top: eleven models across four providers, switchable at runtime. API keys are pasted in the UI, stored locally, never echoed back — there's a test for that. Light, dark, or system theme."

Scene 2 · 官方测试用例：级联 + 评审 + Steam（0:30 – 1:30）

【动作】聊天发送：Add a new competitor to the competitive landscape: Nightingale (survival crafting, co-op focus)。镜头停在进度清单 + 画布。

"The assignment's official test case. The agent edits the landscape, then only the affected modules regenerate in dependency order — audience first, then positioning and SWOT genuinely in parallel. A test in the suite deadlocks if that parallelism were faked."

【动作】紫色 reviewing 状态出现时指向它。

"The purple state: an independent AI judge scores every module against a rubric — below seven, it regenerates with the judge's feedback. Scores land as chips on each card."

【动作】完成后放大 Landscape 卡：依次指 Nightingale 的 new 徽章 → Steam 徽章 → 卡头评分。

"Nightingale arrives with a 'new' badge and a Steam badge — every competitor is verified against the real Steam store, so the AI can't invent games. Misses are flagged, not deleted: console exclusives are real competitors too."

【动作】点开 Positioning 详情 → 指图上的 Nightingale → 切换一个 lens 标签 → Esc 关。

"The matrix kept its axes — cascades preserve them so positions stay comparable — and ships two alternative lenses on the same data."

Scene 3 · 交互画布 (1:30 – 2:05)

【动作】点 Landscape 里的竞品名（如 Rust）→ 弹窗里点一个 segment 链接 → 指迷你矩阵的蓝色聚类 → Esc 关。

"Everything is clickable. A competitor card joins all four modules: its rationale, who plays it, its spot on the matrix, the SWOT items naming it. Inside a segment, its games light up as a cluster — the territory this audience occupies."

【动作】打开 SWOT 详情 → 指四象限和文字里的下划线竞品名 → 版本下拉选一个历史版本指 diff → Esc 关。

"SWOT renders as the classic quadrant, with live links inside each item. Every module keeps its last ten versions — pick one and see exactly what changed since."

Scene 4 · 引用与撤销 (2:05 – 2:45)

【动作】框选 SWOT 某条 threat → 点 "Quote in chat" → 发送：Based on this threat, remove The Elder Scrolls Online from the landscape. 完成后指划线条目 → 点撤销 → 确认复原。

"Quote anything — selected text or a whole module — and the agent acts on a precise reference. The removed item stays as strikethrough."

"Undo isn't just deleting a message: every turn snapshots all four modules, so content, history, and conversation roll back together. The same machinery powers regenerate, edit-and-resend, and stopping mid-generation."

Scene 5 · 工作区 + 导出 + 收尾 (2:45 – 3:15)

【动作】左上切到 input-moonhaven.md，停 3 秒 → 鼠标划过会话下拉/+ /铅笔/垃圾桶 → 切回 input.md。

"Switch the brief and everything swaps to an isolated workspace — a cozy farming sim, so the competitors become Stardew Valley. Chats are multi-threaded like ChatGPT, and each thread remembers its game."

【动作】点击下载按钮 → 打开报告快速滚一屏 → 回到全景定格 2 秒。

"One click exports the full report — Steam flags, all three lenses, judge scores included. GTM Agent: analysis that checks its own work, cites real data, and holds a conversation. Thanks for watching."

剪辑备注

- Scene 2 级联真实耗时 2-4 分钟：全程录下，等待段加速 4-8 倍，保留 reviewing 紫色可辨认的一瞬
- 鼠标放慢，点击前停半秒；分轨录制（先操作后配音）
- 再压缩：砍 Scene 3 的版本历史 + Scene 5 的会话部分 → 约 2:30
